Wetlab notebook

WORKING PROMPTS / EVIDENCE BOUNDARY

No experiment dates or completed measurements have been provided for these entries. They remain explicitly undated prompts. Add the raw file, observation, interpretation, and next decision together when a record is available.

The proposed six-week milestones are a planning schedule. They do not establish an experimental chronology.

Notebook sections

2 | Assembly & transformation

3 | Reporter characterization

4 | Bile-acid growth response

5 | Enzyme characterization assay

UNDATED / AWAITING BENCH RECORD

Assembly & transformation

Record each assembly attempt in chronological order, including deviations, observations, verification evidence, interpretation, and the next build decision.

ENTRY 01

Assembly setup

Add the date, construct version, selected parts, reaction setup, operators, and any deviations from the planned workflow.

ENTRY 02

Transformation and screening

Add colony observations, plate controls, screening results, images, and links to the raw record.

ENTRY 03

Verification and continuation

Add gel or sequencing evidence, interpret accepted and failed junctions, and state which construct advanced or was redesigned.

UNDATED / AWAITING BENCH RECORD

Reporter characterization

Track every reporter run with its four experimental conditions, replicate structure, observations, normalized readouts, interpretation, and follow-up decision.

ENTRY 01

Culture and condition setup

Add the date, construct identities, culture conditions, replicate plan, instrument settings, and deviations.

ENTRY 02

Reporter measurements

Add growth and fluorescence observations for all four conditions with links to raw plate-reader files.

ENTRY 03

Interpretation and continuation

State which comparisons answer the operator and transcription-factor questions and which configuration advanced.

UNDATED / AWAITING BENCH RECORD

Bile-acid growth response

Record each bile-acid response run chronologically, keeping concentration preparation, growth behavior, reporter output, exclusions, and decisions together.

ENTRY 01

Concentration-series setup

Add the date, bile-acid identity, stock preparation, concentration range, plate map, controls, and replicate plan.

ENTRY 02

Growth and reporter observations

Add time-resolved optical density and fluorescence data, anomalies, exclusions, and links to raw files.

ENTRY 03

Interpretation and continuation

Identify the range supported by both growth and normalized reporter evidence, then record the next assay decision.

UNDATED / AWAITING BENCH RECORD

Enzyme characterization assay

Keep sample and construct identity, controls, raw readouts, product confirmation, and interpretation together. The supplied documentation describes assay plans; a dated activity dataset is still required.

Awaiting a dated assay record

The proposed six-week milestones are a planning schedule. They do not establish an experimental chronology.
